Putting new code into Intercom keypad

Turn handset off by holding down **red** call button until screen is blank and take handset to gate unit

1. Press the **green** call button and **red** call button together for 2 seconds until screen shows 3 dashes **- - -**

2. Type *168 into gate unit keypad (sound "Di Di")
3. Type in new code slowly on the gate unit (more than 1 second between each number entry but less than 10 seconds) and as each number is pressed it should show on the handset screen – Note the screen only shows 3 of the 4 numbers.
4. Long press **red** call button to switch the handset off to lock code in.

TEST using the keypad on the gate based unit.

Type *# before the selected code. "Di Di " should sound after a correct entry and the gate should open.
